Data Science Project Number - 1

Name: Aarya Trifale, Roll no: 41

Domain: Underwater Acoustics

Problem Statement: Analyzing the Impac

Problem Statement: Analyzing the Impact of Depth on Sound Intensity in Underwater Environ-

 ${\rm ments}$

```
[18]: #Importing the required libraries and also importing our dataset
import pandas as pd
import numpy as np

file = pd.read_csv("underwater data for ds.csv")
file
```

[500 rows x 11 columns]

Descriptions for each column in the database:

```
<l
```

```
<bsound_type</b>: The type of sound detected (e.g., Ship Noise, Seismic Activity, What
<bsolocation</b>: The geographical location where the sound was recorded (e.g., Indian of the sound event, indicating when it was recorded.
<bsintensity_db</b>: The intensity of the sound in decibels (dB).
<bsdepth_meters</b>: The depth (in meters) at which the sound was detected.
<bsdepth_meters</b>: The duration of the sound event, measured in seconds.
<bsdepth_meters</b>: The estimated frequency of the sound (in Hz).
<bsdepth_meters</b>: The water temperature (in degrees Celsius) at the depth of cli><bsdepth_meters</li>
<bsdepth_meters</li>
<bsdepth_meters
```

[19]: file.head() #.head() returns the first few rows (the "head" of the dataframe i.

[]: !pip install seaborn

```
[49]: #understanding types of sounds
file["sound_type"].hist(bins=20)
plt.show()
```

Histogram of Sound Types:

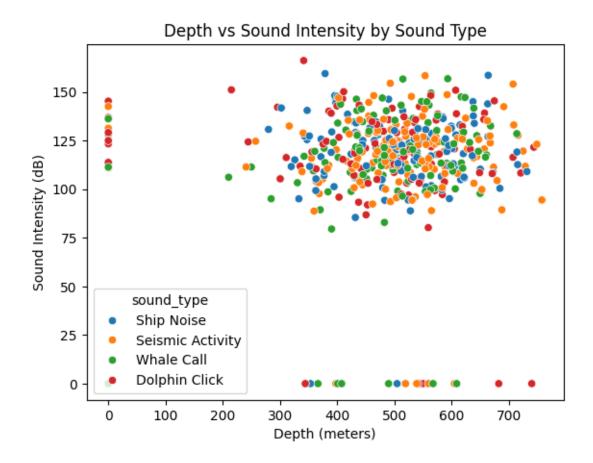

X-axis: Different types of sound available in our dataset

Y-axis: Frequency (count) of each sound type.

This histogram shows the distribution and frequency of sound types in the dataset.

```
[53]: #Scatter plot of all types of sound available in our dataset represented by different colours
import seaborn as sns

sns.scatterplot(x='depth_meters', y='intensity_db', hue='sound_type', data=file)
plt.xlabel('Depth (meters)')
plt.ylabel('Sound Intensity (dB)')
plt.title('Depth vs Sound Intensity by Sound Type')
plt.show()
```

Scatter Plot Explanation:

X-axis (Depth): Depth of water in meters; moving right indicates deeper water.

Y-axis (Sound Intensity): Sound intensity in decibels (dB); moving up means louder sounds.

Colored Dots: Each dot shows sound intensity at a specific depth for a sound type, with colors indicating different sounds (e.g., whale calls, ship noise).

Observations:

The graph shows sound intensity at specific depths for each sound type.

You can see how intensity changes with depth for different sounds.

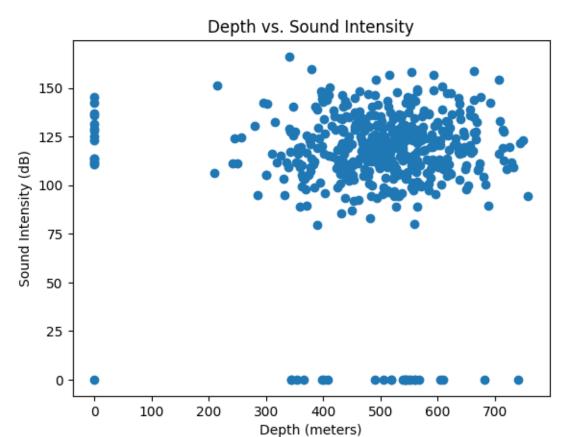

Certain sounds may be louder at specific depths.

Dots of different colors close together indicate multiple sounds at that depth.

This scatter plot illustrates the relationship between depth and sound intensity for various sound types in the underwater environment.

```
[48]: #scatter plot to visualize how sound intensity changes with depth import matplotlib.pyplot as plt import seaborn as sns
```

```
plt.scatter(file['depth_meters'], file['intensity_db'])
plt.xlabel('Depth (meters)')
plt.ylabel('Sound Intensity (dB)')
plt.title('Depth vs. Sound Intensity')
plt.show()
```

Explaination of Scatter Plot of Depth vs. Sound Intensity:

X-axis: Depth of water in meters.

Y-axis: Sound intensity in decibels (dB).

Each dot represents the sound intensity at a specific depth.

This scatter plot visualizes the relationship between water depth and sound intensity.

```
[55]: correlation = file[['depth_meters', 'intensity_db']].corr()
print(correlation)

#The correlation coefficient between depth and sound intensity is -0.003388,__
indicating a
```

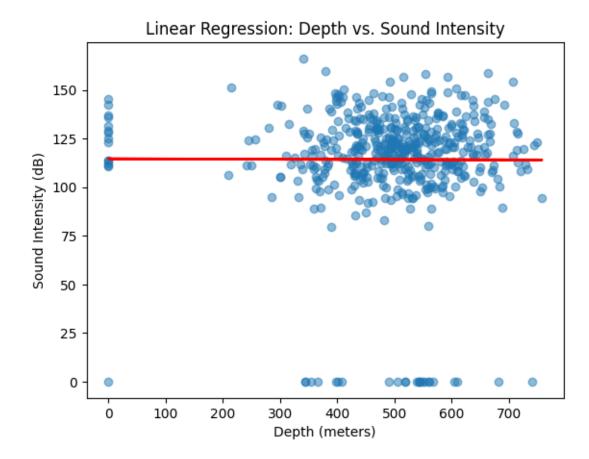

#negligible negative correlation. This suggests that changes in depth do not significantly affect sound intensity in this dataset.

Graph Explanation:

Blue Dots: These are your actual data points. Each blue dot shows the depth of the water (on the x-axis) and the sound intensity at that depth (on the y-axis). So, each dot represents a real measurement: "At this depth, the sound intensity was this much."

Red Line: This is the regression line. It's the best-fit straight line that shows the overall trend of how sound intensity changes with depth. It's what the linear regression model predicts.

If a blue dot is close to the red line, the model's prediction is close to the actual value.

If a blue dot is far from the red line, the model's prediction is less accurate at that depth, but the red line still captures the overall pattern.

In the graph:

The x-axis (horizontal) shows the depth underwater, and the y-axis (vertical) shows the sound intensity.

The red line helps us understand the general relationship: how sound intensity changes as depth increases.
